

# **Impact of observation density in data assimilation: A study with simulated observations**

(QJRMS, 2003, October)

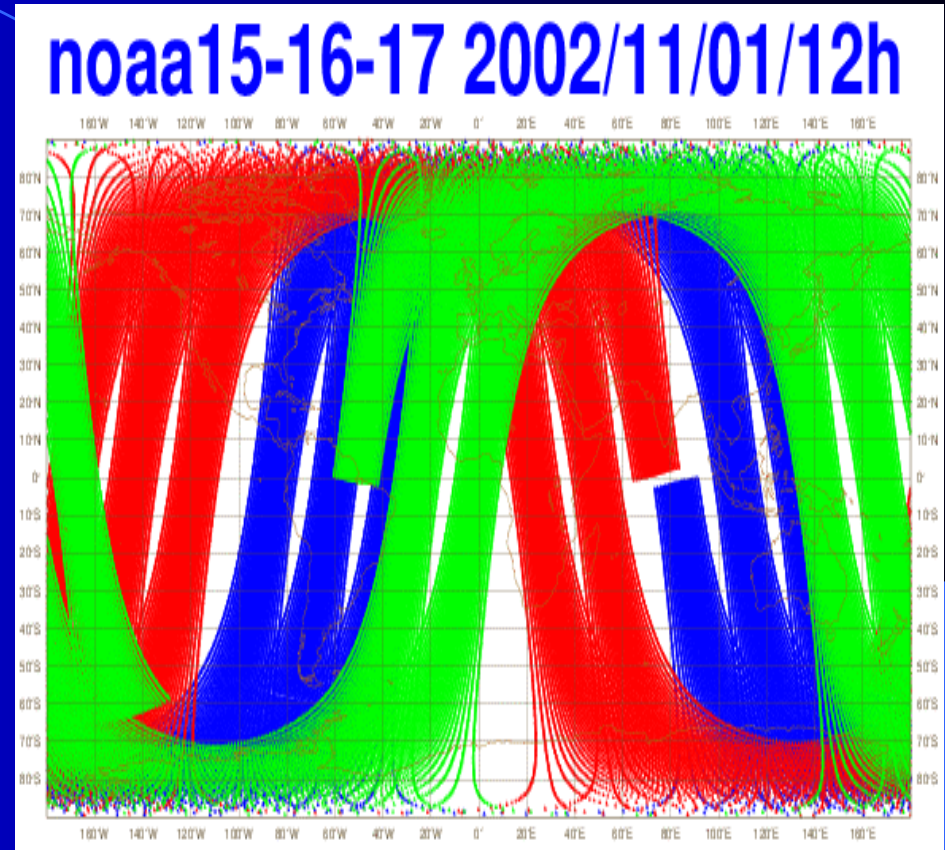

Zhiquan Liu\*, Florence Rabier

Météo-France

\*: Now at National Satellite  
Meteorological Center, Beijing, China

# Rationale

- Increasing number of satellite data. But only 10% ~ 20% are used by QC and sampling of data.
- **Question:** How to determine an optimal sampling distance?

# Conclusions of a 1D-study (Liu and Rabier, QJRMS, 2002)

- For uncorrelated obs error, increasing the obs density improves the analysis
- For correlated obs error
  - Increasing the obs density yields little improvement beyond a given threshold, even with an optimal DA scheme
  - It can even degrade the analysis for a suboptimal scheme not taking into account correlations
  - An optimal sampling can extract most of the information contained in the data

# 3D-study

- ARPEGE, 6h-4DVAR Multi-incremental
- Resolution T199C3.5L31/T42-63-95C1.0L31
- Interesting synoptic cases, including:
  - The second french storm (27/12/1999)
- Simulated Observations (OSSE).
- Impact of obs density with or without correlation on analysis and forecast. The current DA system does not take into account obs error correlation.

# The storm: 27/12/1999, 18Z

4DVAR analysis

962hPa

54h 4DVAR 968hPa  
« truth »

54h 3DVAR 975hPa  
« background »

(a). 4DVAR analysis

(b). 54h forecast from 4DVAR analysis

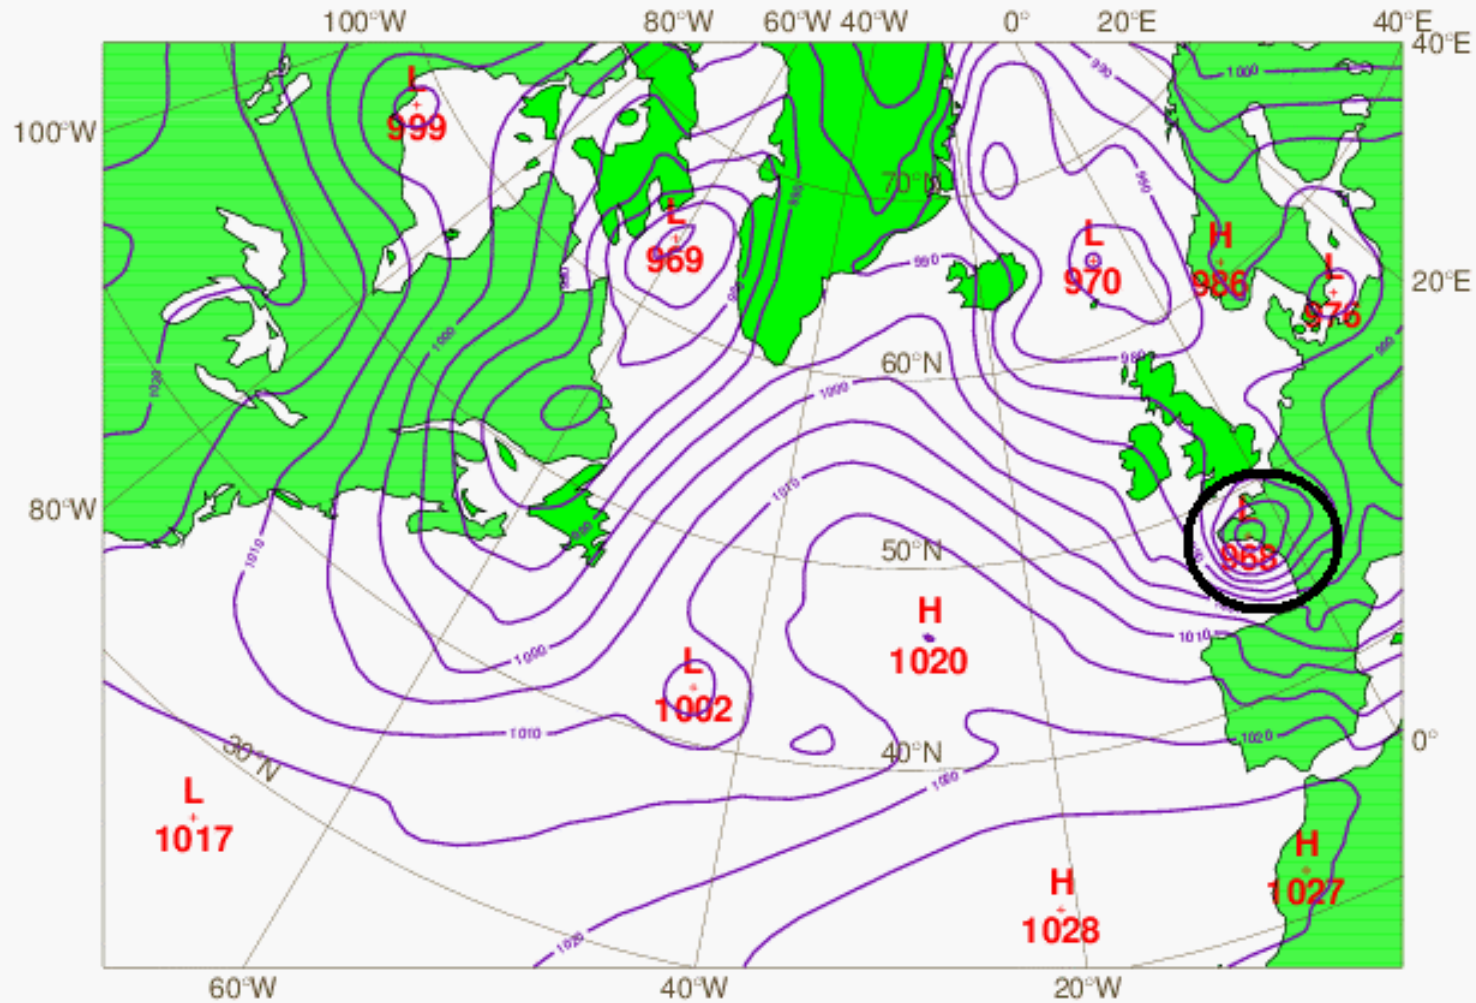

(c). 54 forecast from 3DVAR analysis

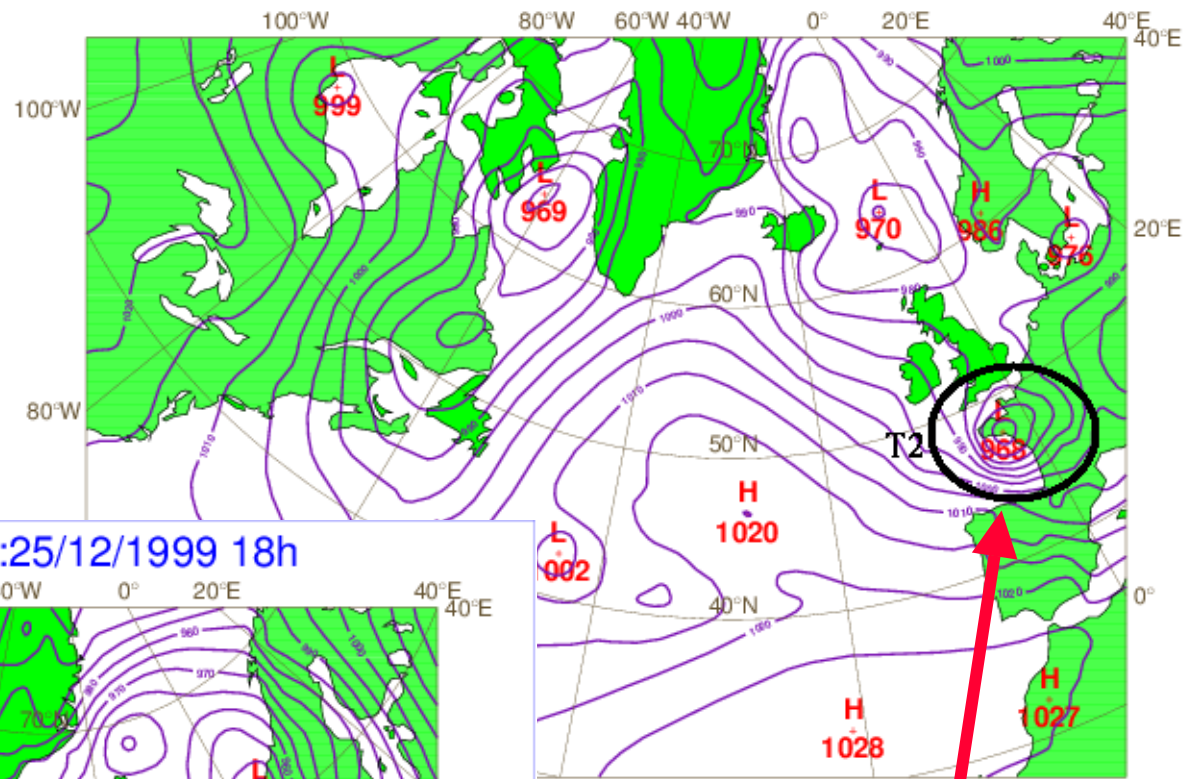

# Movie of the two storms (12Z/25/12/99 ~ 18Z/27/12/99)

Msl Par2\* 25/12/99 12h fc t+54 vt:27/12/1999 18h

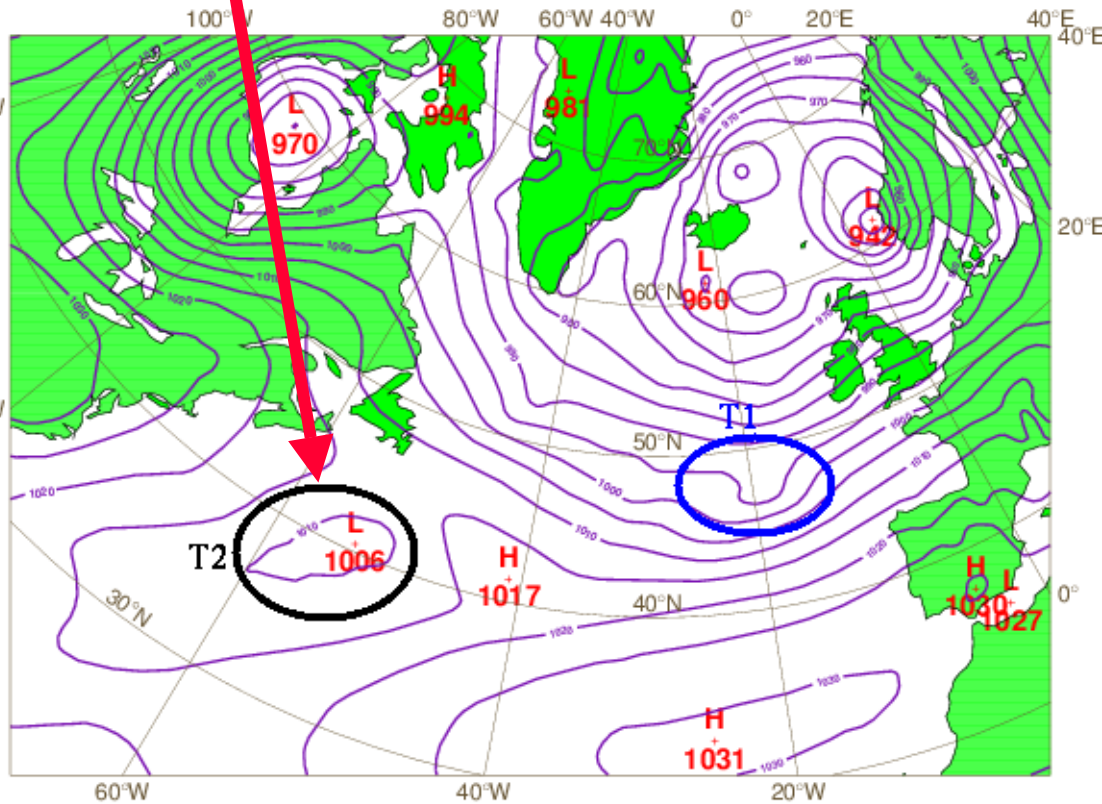

Obs simulated in the sensitive area 48h before the storm (using adjoint computations)

Msl Par2\* 25/12/99 12h fc t+54 vt:27/12/1999 18h

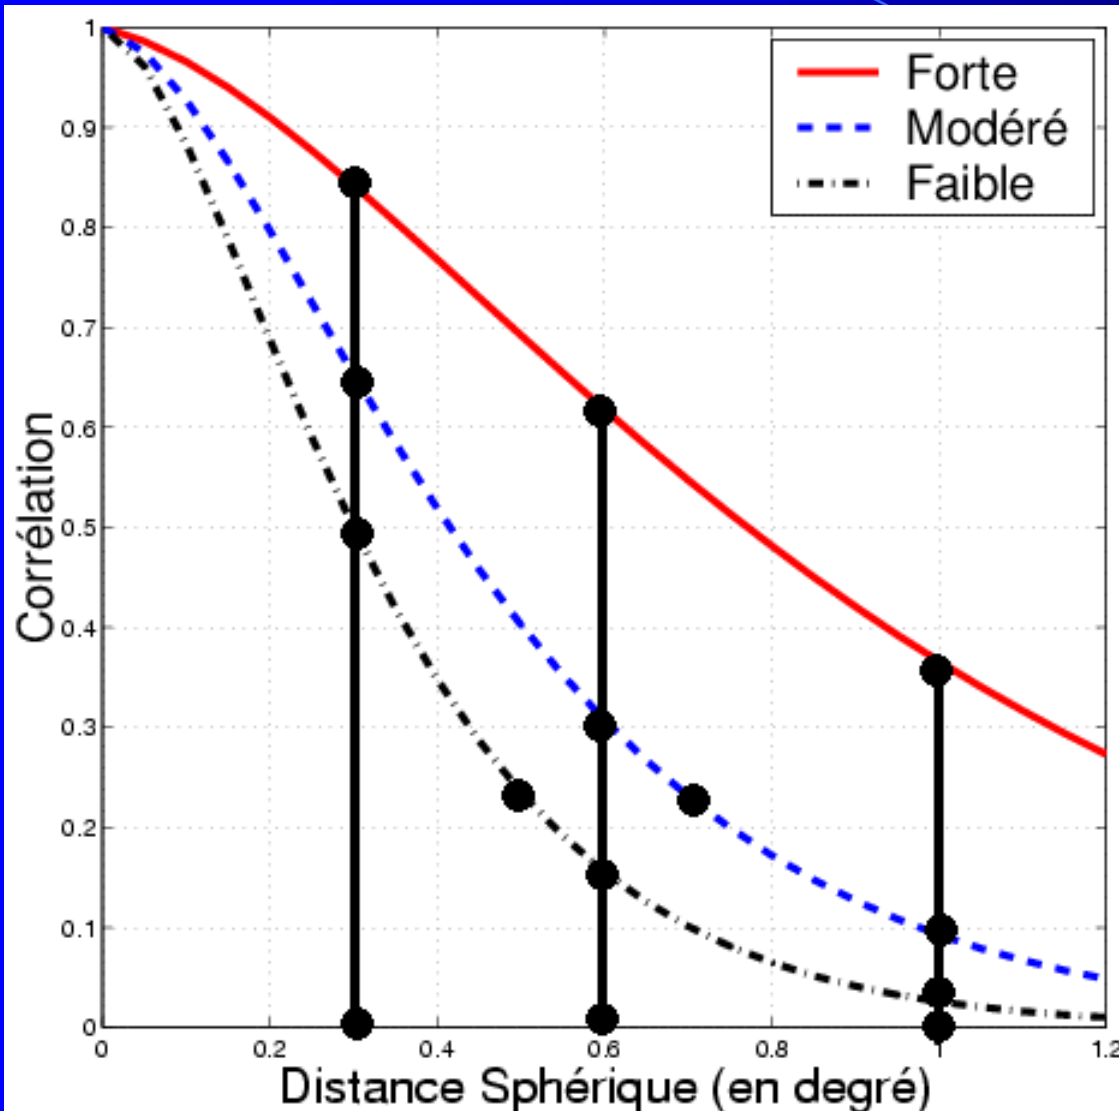

Msl Par2\* 25/12/99 12h fc t+6 vt:25/12/1999 18h

Area of interest

# Simulated obs error correlation model

1. T (31levels) + Ps

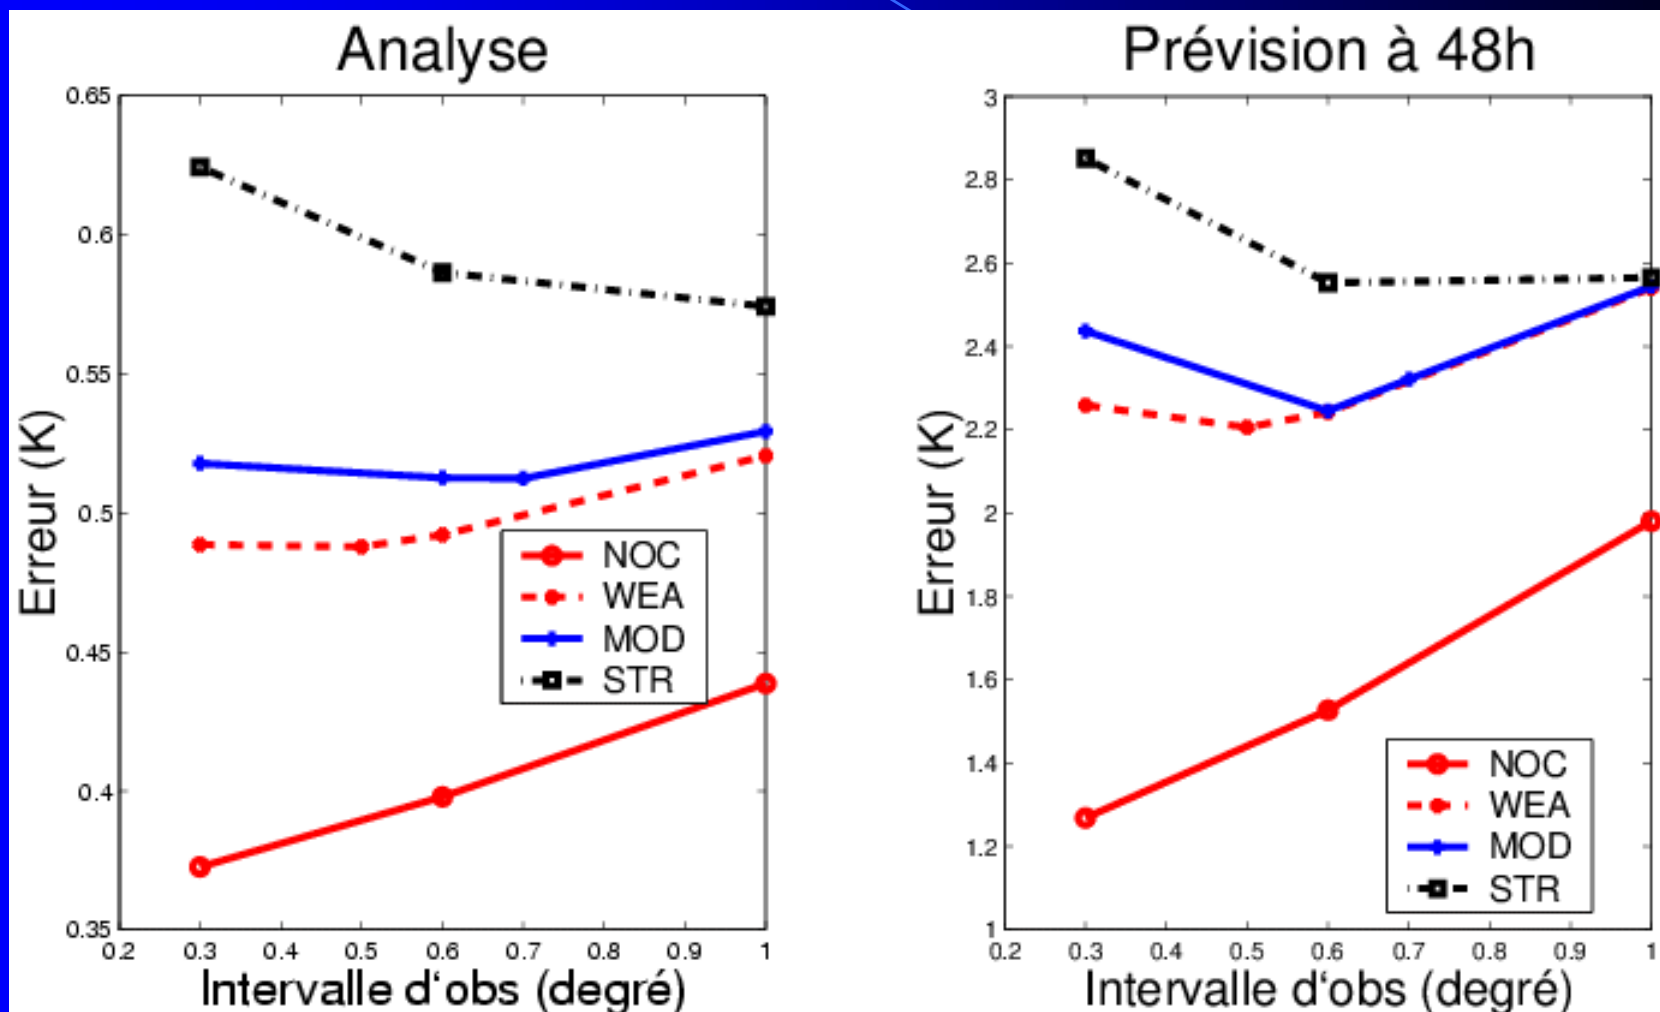

2. Only in the sensitive area (3066 gridpoints)

3. Isotropic Correlation

4. 14 experiments with 10 random realisations each

# Averaged T error (all levels, 10 realisations)

# Forecasts for 6 experiments (mean over 10 realisations)

(a) NOC0.3

(b) NOC0.6

(c) NOC1.0

(d) MOD0.3

(e) MOD0.6

(f) MOD1.0

# Conclusions

- Confirmation of the 1D results. A correlation around 0.2 could provide an optimal sampling.
- High density data in sensitive areas are important for the forecast. There does not seem to be a limit set by  $L_b$  or  $\Delta x$ .
- A low vertical resolution does not prevent the use of high horizontal density data.

# Other options for using the correlated obs

- Sampling or averaging obs?
- Modelling obs error horizontal correlation
- Inflating obs error  $\sigma_o$  specified in the obs error covariance matrix.

# Inflating obs error
