

Assimilation of Level-1D ATOVS Radiances in the Australian Region LAPS System

C. Tingwell, B. Harris, P. Steinle, W. Bourke,
M. Naughton, G. Roff and J. Paevere

Bureau of Meteorology Research Centre

Bureau of Meteorology, Melbourne, Australia

The Domains of the Operational Suite of

Numerical Weather Analysis and Prediction Systems

GASP

Global Analysis and Prediction System

- T₁₂₃₉ (smallest half wavelength resolved - 83 km)
- 29 levels
- Prediction to 6 days

LAPS

Limited Area Prediction System
Australian Region

- 0.375° horizontal grid spacing
- 29 levels
- Prediction to 72 hours

TLAPS

Tropical Limited Area Prediction System

- 0.375° horizontal grid spacing
- 29 levels
- Special features for tropical analysis
- Prediction to 48 hours

MESO-LAPS

Smaller scale versions of LAPS

- 0.05°-0.125° horizontal grid spacing
- 29 levels
- Prediction to 36 hours
- Special version for tropical cyclone prediction

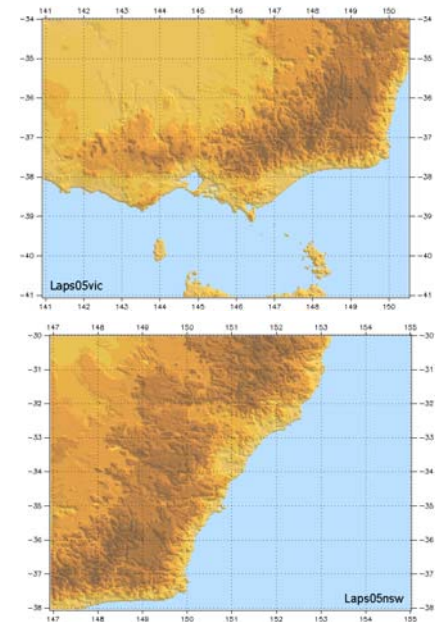

LAPS 0.375° grid

MESOLAPS 0.125° grid

TXLAPS 0.375° grid

CITY-CENTRED DOMAINS 0.05° grids

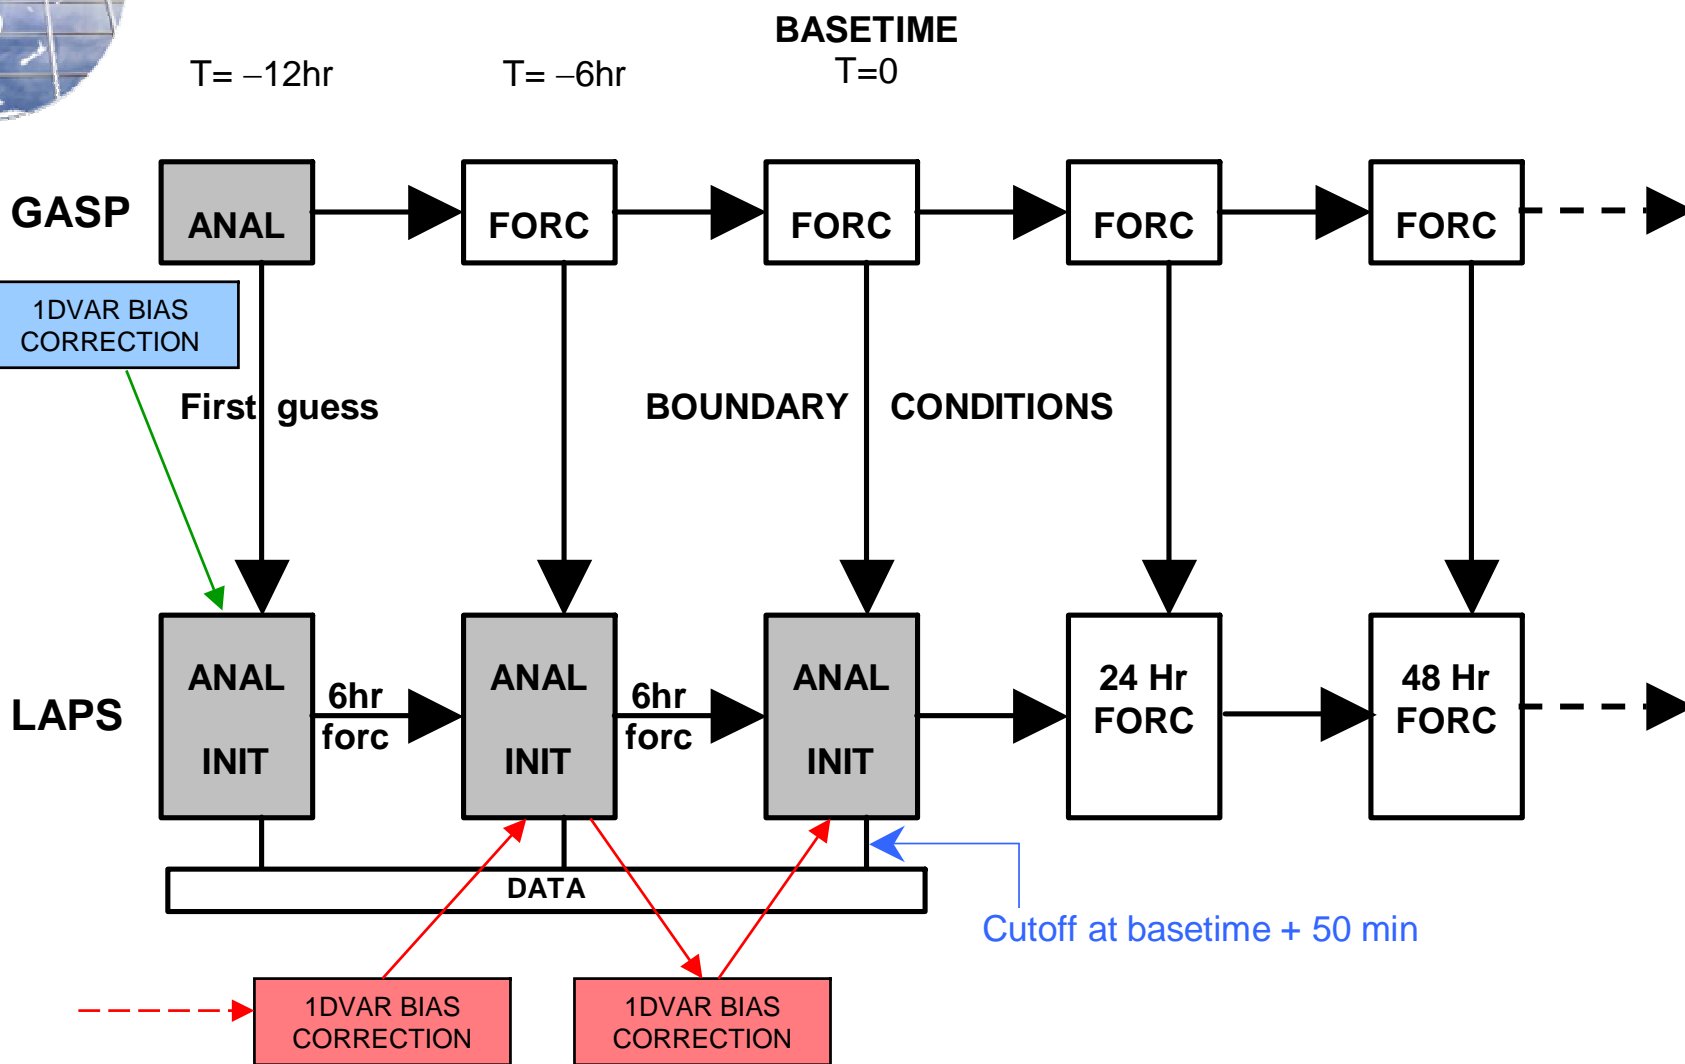

LAPS Configuration

- Hydrostatic
- Miller-Pearce explicit time-stepping scheme
- Third order upwinding advection scheme
- ECMWF land surface and vertical diffusion scheme
- Radiation: Fels-Schwartzkopf (SW) Lacis-Hansen (LW)
 - ==> Sun-Edwards-Slingo
- Convection: Tiedtke's, early ECMWF mass flux scheme with MC trigger and closure. ==> CAPE closure
- Large Scale Rain : Bulk Explicit Microphysics

RTTOV-7

1DVAR in the Bureau of Meteorology

$$\min J = (x - x_b)^T \mathbf{B}^{-1} (x - x_b) + (y_0 + y(x))^T [\mathbf{E} + \mathbf{F}]^{-1} (y_0 - y(x))$$

x_b : background field

y_0 : observed radiances

x : control vector

\mathbf{B} : background error covariance matrix

$\mathbf{E} + \mathbf{F}$: Observation and Forward model error covariance

$y(x)$: Forward operator

- Purser type dynamic error scaling
- Air mass dependent radiance bias predictors & bias monitoring
- Latitudinally varying scan correction
- Implemented operationally in GASP July 2000, LAPS Sept 2002

Comparison of locally received and processed (AAPP) NOAA-17 1D radiances with corresponding NESDIS values

NESDIS radiance

Local AAPP radiance

LAPS 60-level Trials

1. All Met Office 1D radiance data available to final (base date-time) analysis
 2. Restricted set of Met Office 1D radiances available to final analysis – simulates impact of early cut-off
 3. NESDIS radiances (as used by operational LAPS system) used for all analyses
 4. Locally received and processed 1D radiances used in final analysis
- All experiments nested in same GASP L60 trial
 - All other data types as per operational model

Conclusions

- Significant improvement in forecast quality from transition to 60 vertical levels in LAPS
- Additional improvement from use of AAPP derived 1D radiances
- Early cut-off may be a less significant issue for final (base date-time) analysis
- Successful assimilation of locally received and processed radiances

Further work

- AMSU-B
- Rainfall forecast verification
- Aqua
- GenSI/3D-VAR
- Mesoscale (10 km) assimilation
 - more frequent (3 hourly) insertions
 - earlier data extraction cut-offs
 - ⇒ local radiances essential
